

## TERM06/PUB

Industrial terminals **TERM06A** by **SofCon** company asserted in self-service beer bars **The P.U.B. (Pilsner Unique Bar)**.

The P.U.B. is a net of bars of new generation, using a world unique self-service draft system, placed on every single table. The first bar of this kind was opened in Plzen in 2005. All project was established due to cooperation of three companies **Pilsner Urquell**, **LUKR Ingeneering s.r.o.** and **MCAT Automation s.r.o.**.

The taps are centrally supplied from cooled beer box, where is the beer kept in 3000 liters beer tanks. The non pasteurized beer is kept in plastic sack, which is placed in the tank and is pushed out, using the air, which occurs in the space between the rustfree wall of the tank and the plastic sack. The beer does not come into straight contact with driving gas, which means, it is of higher quality. The beer sub-cooled all the way to every single table.

The tap head consists of up to 3 tapes, rotary control panel with terminal **TERM06A**, which displays the amount of draught beer and serves as a communication point with the staff. There is also draining board and glass rinse system.

This system enables the customers to get the beer of the highest possible quality in the right moment, which is the moment when the beer is draught.

You will find more bars of this kind in Tabor or Brno.
